

# The +hinkingMath Handy Guide

## Volume 2

Misconception due to misinterpretation or an inability to understand context often occurs and gives rise to errors when solving mathematical word problems, short-answer and even multiple-choice questions.

This can be frustrating when you thought that your child has fully grasped all mathematical concepts and worked tirelessly through all materials to reinforce understanding and yet he could not get the questions right. Why is this so? And what can you do about it?

This +hinkingMath Handy Guide, developed by the onSponge team, addresses the 12 most common misconceptions about word problems. Presented in an easy-to-understand format, it explains how each misconception arises and how students can avoid it. This guide aims at reinforcing the areas of improvement — with a study of the reasons and practice questions, it will help eliminate errors due to misconceptions and bring your child closer to that A/A\*.

Statement	True	False	Not possible to tell
Area of Figure 1 is equal to area of Figure 2.	✓		
Perimeter of Figure 1 is equal to perimeter of Figure 2.		✓	

For the first statement, since the number of rectangles in both figures are the same, and these rectangles are identical, the area of the figures are equal.

For statement 2,

The length of each identical rectangle is 3 times its breadth.

Perimeter of Figure 1 is made up of 6 lengths and 2 breadths which is the same as 20 breadths.

Perimeter of Figure 2 is made up of 4 lengths and 6 breadths which is the same as 18 breadths.

Hence, the perimeter of Figure 1 is more than the perimeter of Figure 2.

For the first statement, since the number of adults is 2 units and the number of children is 3 units, there are more children than adults.

For the second statement, the number of boys is 2 units and the number of girls is 1 unit. Hence, there are more boys than girls.
